

LIFT AND TREAT SOIL REMEDIATION

CANADIAN COUNTY
AUGUST 2022

Rose Rock was contracted to provide remediation efforts for a release that occurred at a production site. Soil samples were taken throughout the impacted area and sent to a laboratory to be analyzed. Once results were received, Rose Rock's team used our in-house salt remediator treatment agent to till and treat the soil in place throughout the majority of the impacted area. A lift and treat remediating technique was used for the remaining area. This entailed the Rose Rock team excavating the top layer of soil in order to treat the impacted area at a lower depth. Once the lower base had been remediated, the area was backfilled and treated in place, resulting in two layers of remediated soil. After remediation efforts, Rose Rock returned to the site to perform a watering treatment on three occasions. New soil samples were then collected in order to confirm the treatment had been successful.
